

AQUABLOCK PLUMBING RECOMMENDS RWP SYSTEMS

As an accredited GreenPlumbers® plumber, Aquablock Plumbing in Victoria offers specialised expertise in water conservation – including rainwater harvesting and reuse.

Aquablock began installing the RWP and RWPi series of rainwater pump systems as part of their involvement in Community Water Grants installations throughout Victoria.

“We were introduced to the RWP systems by the GreenPlumbers® group” explains Rob Lakin, Environmental/Marketing Manager at Aquablock. “We were originally contracted to install the systems on behalf of GreenPlumbers® and we now use and recommend the systems in our everyday business.”

Performance was a key priority for Aquablock in the selection of the system. “Once a person has made the decision to invest in rainwater harvesting and reuse, it is critical that the system works in a way that minimises impact on their daily life” he explains. “Otherwise, you run the risk of their mindset changing from a positive ‘I can do this’ attitude to one that is more along the lines of ‘great idea but it’s just not practical’. This is why we use the RWP systems.”

The RWP and RWPi systems ensure automatic and seamless transition between rainwater and mains water. Not only does the system feature a robust, field proven design, it has been specifically developed to ensure that in the event of electrical outage or no rainwater, it automatic reverts to mains water supply (thereby ensuring no interruption to water supply). According to Mr Lakin, “...more importantly, the system can be completely removed for maintenance or servicing should there be a need. From a plumber’s point of view, this is an enormous benefit over other systems available.”
